## Technor.

## Technical Information

## Selecting a Ball Screw Slide

First, you must determine...

Travel Distance<br>Load<br>Orientation of Load<br>Cycle Time<br>Max rpm of Screw<br>Max Speed<br>Max Acceleration<br>Required Torque to Drive Load

With this information, you can start to determine which ball screw slide is suitable for your application.

## Loading Capacity and Life Expectancy

## Fundamental Principle

The specification of a linear guide is based on the loading capacity of the individual element. The loading capacity is described by:

- the dynamic load data C
- the static load data $\mathbf{C}_{0}$
- the static moments $\mathbf{M}_{\mathbf{x}}, \mathbf{M}_{\mathbf{y}}, \mathbf{M}_{\mathbf{z}}$

The basis of the dynamic load data, according to DIN standards, is a nominal life expectancy of $100,000 \mathrm{~m}$ travel. For a nominal life expectancy of $50,000 \mathrm{~m}$, the load data is $20 \%$ higher than those values supplied in this catalog.

## Dynamic Loading Capacity

The fatigue behavior of the materials determines the dynamic loading capacity. The life expectancy is dependent on:

- the load on the linear guide
- the travel speed of the linear guide
- the statistical contingency of the first defect taking place

## Nominal Life Expectancy

The nominal life expectancy is achieved, or exceeded $90 \%$ of the time before the first indication of fatigue appears.
$\mathbf{L}=\left(\frac{\mathbf{C}}{\mathbf{P}}\right)^{p} \times 1 \times 10^{5} \mathrm{~m}$
$\mathbf{L}_{\mathrm{h}}=\frac{833}{\mathbf{H} \times \mathbf{n}} \times\left(\frac{\mathbf{C}}{\mathbf{p}}\right)^{\mathrm{p}}$
$\mathbf{L}_{\mathrm{h}}=\frac{1666}{\mathbf{V}} \times\left(\frac{\mathbf{C}}{\mathbf{P}}\right)^{\mathrm{p}}$
$\mathbf{L}$ [m] nominal life expectancy in meters
$L_{h}[h] \quad$ nominal life expectancy in operating hours
C [N] dynamic load
$\mathbf{P}[\mathrm{N}] \quad$ dynamic equivalent load
p Life expectancy index:
ball-bearing linear guides: $\mathbf{p}=3$
roller bearing linear guides: $\boldsymbol{p}=10 / 3$

## Technical Information

H [m] single stroke length
$\mathbf{n}$ [min] number of complete strokes per minute
$\mathbf{v}$ [m/min] average travel speed

## Usable Life

The actual life expectancy achieved by a linear guide is known as usable life. The usable life can deviate from the calculated life expectancy.

These conditions can lead to early defects:

- alignment error between guide rails or guide elements
- insufficient lubrication
- oscillatory motion with very small strokes (rippling)
- vibration during standstill (rippling)

Due to the variation in installations and operating conditions, it is not possible to determine the exact usable life of a linear guide in advance. The safest method to obtain a correct assessment of the usable life is to compare cases with similar installations.

## Combined Loading Capacity

When the loading direction of an element does not coincide with one of the loading directions, this is the way the equivalent load is calculated as follows:

$$
\begin{equation*}
\mathbf{P}=\left|\mathbf{F}_{\mathbf{1}}\right|+\left|\mathbf{F}_{\mathbf{2}}\right| \tag{5}
\end{equation*}
$$

for a force $\mathbf{F}$ and a moment $\mathbf{M}$ at the same time, the dynamic equivalent load is:
$\mathbf{P}=|\mathbf{F}|+|\mathbf{M}| \times \frac{\mathbf{C}_{0}}{\mathbf{M}_{\mathbf{0}}}$
$\mathbf{P}[\mathrm{N}] \quad$ dynamic equivalent load
$\mathbf{F}[\mathrm{N}] \quad$ applied force $=\sqrt{\mathbf{F}_{1}{ }^{2}+\mathbf{F}_{2}{ }^{2}}$
$\mathrm{F}_{1}[\mathrm{~N}] \quad$ vertical components, see sketch (4)
$\mathrm{F}_{2}[\mathrm{~N}] \quad$ horizontal components, see sketch (4)
$\mathrm{C}_{0}[\mathrm{~N}] \quad$ static load in the direction of the applied force

M [N•m] applied moment
$\mathbf{M}_{0}[\mathrm{~N} \cdot \mathrm{~m}]$ static moment in the direction of the applied moment

According to DIN standards, the dynamic equivalent load should not exceed the value $\mathbf{P}=0.5 \times \mathbf{C}$.

Load and Moment Data for Techno Ball Screw Driven Slides

| Model | Standard-Duty | Heavy-Duty 2 | Narrow Profile 1 | Narrow Profile 2 |
| :---: | :---: | :---: | :---: | :---: |
| \# of carriages | 4 carriages | 4 carriages | 1 carriage | 1 or 2 carriages |
| Carriage type | Series 1 <br> Carriage 1 | Bearing <br> Carriage 4 | Series 1 <br> Carriage 1 | Bearing <br> Carriage 4 |
| F1 stat $[\mathrm{N}]$ | 430 | 800 | 430 | 800 |
| F1 dyn $[\mathrm{N}]$ | 400 | 500 | 400 | 500 |
| F2 stat $[\mathrm{N}]$ | 430 | 800 | 430 | 800 |
| F2 dyn $[\mathrm{N}]$ | 400 | 500 | 400 | 500 |
| $\mathbf{M x ~ s t a t ~}[\mathrm{~N} \cdot \mathrm{~m}]$ | 7.3 | 12.6 | 7.3 | 12.6 |
| $\mathbf{M y ~ s t a t ~}[\mathrm{~N} \cdot \mathrm{~m}]$ | 3.7 | 22 | 3.7 | 22 |
| $\mathbf{M z}$ stat $[\mathrm{N} \cdot \mathrm{m}]$ | 3.7 | 12.6 | 3.7 | 12.6 |
| $\mathbf{M x d y n}[\mathrm{~N} \cdot \mathrm{~m}]$ | 7.3 | 7.4 | 7.3 | 7.4 |
| $\mathbf{M y}$ dyn $[\mathrm{N} \cdot \mathrm{m}]$ | 3.7 | 13 | 3.7 | 13 |
| $\mathbf{M z}$ dyn $[\mathrm{N} \cdot \mathrm{m}]$ | 3.7 | 7.4 | 3.7 | 7.4 |

NOTE: See formulas in load bearing mechanisms' section of technical section.
Load and moment data are per carriage.

## Technical Information

## Drive Dimensioning and Calculation of Drive Torque

The nominal drive torque consists mainly of 'load torque', 'acceleration torque' and 'no-load torque'.

## Definitions

| $\mathbf{M a}_{\text {A }}[\mathrm{N} \cdot \mathrm{m}]$ | required drive torque |
| :---: | :---: |
| $\mathbf{M}_{\text {Last }}[\mathrm{N} \cdot \mathrm{m}]$ resulting load torque |  |
| $\mathbf{M}_{\text {NLT }}[\mathrm{N} \cdot \mathrm{m}]$ no load torque* |  |
| $\mathbf{M}_{\text {rot }}[\mathrm{N} \cdot \mathrm{m}$ | rotary acceleration torque |
| $M_{\text {trans }}$ [ N . | acceleration torque |
| $F_{\mathrm{x}}[\mathrm{N}]$ | feed force |
| $F_{a}[\mathrm{~N}]$ | acceleration force |
| $g\left[\mathrm{~m} / \mathrm{s}^{2}\right]$ | gravity $=9.81$ |
| $\mathbf{V}_{\text {max }}[\mathrm{m} / \mathrm{s}]$ | max feedrate |

$F_{E}[N] \quad$ external force
p [mm] screw lead
$\mathbf{m}[\mathrm{kg}]$ total mass to be moved
a $\left[\mathrm{m} / \mathrm{s}^{2}\right.$ ] acceleration
$\mathbf{P}$ [kW] driving power
$\mathbf{n}_{\text {max }}[1 / \mathrm{min}]$ max. speed
$\mu \quad$ friction factor $=0.05$
$\mathbf{M}_{\mathbf{E}}[\mathrm{N} \cdot \mathrm{m}]$ external load torque
$\mathrm{J}_{\text {syn }}\left[\mathrm{Kgm}^{2} / \mathrm{m}\right]=0.0000325$

$$
\mathrm{m}=\mathrm{mass} \text { of load }+ \text { mass of carriage(s) }
$$

*relevant data are given on the following data sheets for the Ball Screw Slides

Acceleration Force $F_{a}$

$$
F_{a}=\mathbf{m} \times \mathbf{a}
$$

with vertical loads, the acceleration to gravity g must be added to the mass acceleration ( $\mathrm{g}=9.81 \mathrm{~m} / \mathrm{s}^{2}$ )

Feed Force $\mathrm{F}_{\mathrm{x}} \quad$ External Torque $\mathrm{M}_{\mathrm{E}}$

$$
F_{x}=m \times g \times \mu
$$

Resulting Torque $\mathbf{M}_{\text {Last }}$

$$
M_{E}=\frac{F_{E} \times d_{0}}{2 \times 1000}
$$

$$
M_{\text {Last }}=\frac{F_{x} \times p}{2} \frac{p}{\pi \times 1000}
$$

Driving Power $\mathbf{P}$

$$
\mathbf{P}=\frac{\mathbf{M}_{A} \times \mathbf{n}_{\max } \times 2 \pi}{60 \times 1000}
$$

Acceleration Torque $\mathbf{M}_{\text {trans }}$

$$
\mathbf{M}_{\text {trans }}=\frac{\mathbf{F}_{\mathbf{a}} \times \mathbf{p}}{2 \pi \times 1000} \quad \mathbf{M}_{\text {rot }}=\frac{\mathbf{J}_{\text {syn }} \times \mathbf{L} \times \mathbf{n}_{\text {max }} \times 9 \times 2 \pi}{\mathbf{V}_{\text {max }} \times 60 \times 1000}
$$

Rotary Acceleration Torque $\mathbf{M}_{\text {rot }}$

Drive Torque Formula:

$$
M_{A}=M_{\text {Last }}+M_{\text {trans }}+M_{\text {rot }}+M_{\text {NLT }}+M_{E}
$$

Selecting a Ball Screw Slide

## No-Load Torque Charts

Standard-Duty Slides

| No-Load Speed (rpm) | No-Load Torque (N <br> Screw Pitch |  |  |
| :---: | :---: | :---: | :---: |
|  | $\mathbf{5}$ | $\mathbf{1 0}$ | $\mathbf{2 0}$ |
|  | 0.18 | 0.2 | 0.21 |
| $\mathbf{1 5 0 0}$ | 0.22 | 0.24 | 0.25 |
| $\mathbf{3 0 0 0}$ | 0.26 | 0.29 | 0.3 |

Heavy-Duty 2 Slides

| No-Load Speed (rpm) | No-Load Torque (N <br> Screw Pitch |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{2 . 5}$ | $\mathbf{5}$ | $\mathbf{1 0}$ | $\mathbf{2 0}$ |
| $\mathbf{5 0 0}$ | 0.18 | 0.2 | 0.21 | 0.22 |
| $\mathbf{1 5 0 0}$ | 0.24 | 0.24 | 0.25 | 0.26 |
| $\mathbf{3 0 0 0}$ | 0.26 | 0.29 | 0.3 | 0.32 |

Narrow Profile 2 Slides

| No-Load Speed (rpm) | No-Load Torque (N • m) <br> Screw Pitch |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{2 . 5}$ | $\mathbf{5}$ | $\mathbf{1 0}$ | $\mathbf{2 0}$ |
| $\mathbf{5 0 0}$ | 0.15 | 0.16 | 0.17 | 0.18 |
